

Practical 6:

Comparing SIA to measured flow speeds

Download the data from here:

https://storage.googleapis.com/Ideo-glaciology/measures_and_bedmap/P6_data.npz

Goal: create a script to compare measured speed to speed computed using the SIA, along lines in Antarctica.

Notes:

Ice speed data:

contains maps of the two components of horizontal surface velocity at the surface of the Antarctic ice sheet. *x_velocity* and *y_velocity* are polar stereographic coordinates in meters. *u* and *v* are the two horizontal components of surface speed in meters/year – *u* is in the *x* direction and *v* is in the *y* direction.

Ice thickness data:

contains maps of ice thickness and slope on a different grid to the speed data. *x_bedmap* and *y_bedmap* are polar stereographic coordinates in meters. *ice_thickness* is ice thickness in meters. *surface_slope* is surface slope (dimensionless).
